

Swine Influenza: What Connecticut Residents Need To Know

www.ct.gov/ctfluwatch

What is swine influenza? Swine flu is a respiratory infection caused by influenza viruses that regularly cause outbreaks in pigs. There have been reports of serious illness and deaths due to swine flu in Mexico, but the recently confirmed cases in the United States have been mild.

What are the symptoms of swine influenza? Swine flu symptoms appear to be similar to the symptoms of regular human flu and include fever, cough, sore throat, body aches, lethargy, headache, chills and fatigue. Some people have reported diarrhea and vomiting associated with swine flu

How does swine influenza spread? Swine flu viruses can be directly transmitted between pigs and people. Human-to-human transmission is also possible, and appears to be occurring with this outbreak. Spread is mainly through coughing or sneezing. People may become infected by touching something with flu viruses on it and then touching their mouth or nose.

Who is at risk for swine influenza? Anyone who has contact with an infected person may be exposed to swine flu. Human transmission is thought to occur in the same way as seasonal flu: through aerosolized particles that are released when an infected person coughs or sneezes.

How can I protect myself from swine influenza?

Here are the best ways to avoid getting or spreading swine influenza:

- Encourage all people to cover their mouth and nose when they cough or sneeze.
- Wash your hands often with soap and water, especially after you cough or sneeze. Alcohol-based hand cleaners are also effective.
- Try to avoid close contact with sick people.
- If you get sick, limit contact with others to avoid infecting them.

These are the same protections as those for seasonal flu and many other respiratory infections.

What should I do if I have flu-like symptoms?

Anyone experiencing fever, cough or sore throat should stay home from work or school for at least 7 days, and not return until one to two days after the symptoms end. Wash your hands frequently. And as always cover your mouth and nose when you cough or sneeze. You do *not* need to go to the hospital for mild illness, but anyone with severe symptoms, such as difficulty breathing, should seek health care and treatment immediately.

Should I be tested for swine flu?

Knowing you have swine flu will not affect the treatment you receive, but testing certain affected people can help health authorities track the spread of the disease. Diagnosis of swine flu requires two sets of laboratory tests. The Health Department recommends testing only when people experience severe symptoms or fall sick in clusters. The laboratory tests require only a nasal swab.

Is there a vaccine for swine flu?

At this time, there is no vaccine for swine flu. The season influenza vaccine does not provide protection against swine flu. This makes ordinary precautions, such as covering coughs and washing hands, all the more important.

If I experience flu symptoms, do I need medication?

The antiviral medicines Tamiflu (oseltamivir) and Relenza (zanamivir) can help alleviate swine flu symptoms, and are particularly important for people with severe illness or with risk factors for complications from flu. Groups that are normally at higher risk of complications include young children, the elderly, and people with chronic illness. Flu patients who belong to those risk groups should seek treatment. Treatment may also be appropriate for household members with special risk factors, to help prevent the infection.

What are the signs of more severe illness with swine flu?

While the current swine influenza cases have been mild so far, infected individuals should still be aware of some of the more severe illness with swine flu. If you become ill and experience any of the following warning signs, seek emergency medical care.

In children emergency warning signs that need urgent medical attention include:

- Fast breathing or trouble breathing
- Bluish skin color
- Not drinking enough fluids
- Not waking up or not interacting
- Being so irritable that the child does not want to be held
- Flu-like symptoms improve but then return with fever and worse cough
- Fever with a rash

In adults, symptoms that need emergency medical attention include:

- Difficulty breathing or shortness of breath
- Pain or pressure in the chest or abdomen
- Sudden dizziness
- Confusion
- Severe or persistent vomiting

What should I do if someone I live with is sick with flu-like symptoms?

If the symptoms are severe, the person should see a medical provider. If the affected person has had close contact with a probable or confirmed case of swine flu, the provider may suggest testing for swine flu.

What should I do if someone I live with has confirmed swine flu?

Follow the same precautions you would to avoid ordinary seasonal flu:

- Limit your contact with the affected person. Avoid close contact such as kissing, and do not share towels, glasses or toothbrushes with the affected person.
- Avoid having visitors. If visitors must enter the home, they should avoid close contact with the affected person.
- Wash your hands with soap and water or with an alcohol-based hand rub.
- Consider using a facemask or an N95 respirator. These can be purchased at a pharmacy or hardware-type store. If you use a reusable fabric facemask, it should be laundered with normal laundry detergent and tumble-dried in a hot dryer.
- Wash dirty dishes and eating utensils in either a dishwasher or by hand with warm water and soap. You do not need to separate eating utensils for use by a patient with influenza.
- It is fine to do your laundry in a standard washing machine with warm or cold water and detergent. It is not necessary to separate the patient's laundry.

Can household cleaning help prevent transmission?

Yes. To help prevent transmission, all hard surfaces, such as doorknobs, refrigerator door handles, telephones, and bathroom surfaces, should be washed with soap or detergent, rinsed with water and then

disinfected and rinsed. Disinfectants are those with “registered disinfectant” on the label. If disinfectants are not available, use a chlorine bleach solution made by adding 1 tablespoon of bleach to a quart (4 cups) of water. Use a cloth to apply this to surfaces and then rinse them with water. Dispose of the used bleach solution and mix a fresh solution when repeating the cleaning process. Use sanitizer cloths to wipe electronic items (phones, computes, remote controls) that are touched often.

What can I do if my anxiety about the situation feels overwhelming?

Seeking information is healthy, but watching report after report about swine flu may be distressing, especially for children. Parents should limit children’s news-watching, watch the news with their children, and talk to them about the events that are occurring.

I was in Mexico recently. Does that mean I’m at risk?

Not necessarily, but you should pay close attention to your health for the first 7 days after you return home. If you become sick with a fever and a cough or sore throat, or you have trouble breathing during this period, see a doctor. When you make the appointment, tell the doctor:

- Your symptoms
- Where you traveled
- If you have had close contact with a sick person or farm animals.

Should I send my children to school?

Yes. There is no reason for anyone else to keep their children at home unless they are sick.

What is the Health Department doing about the swine flu outbreaks in Connecticut?

Governor M. Jodi Rell has asked the Department of Public Health (DPH) to closely monitor the swine flu outbreaks. The DPH has asked hospitals to increase surveillance of potential flu cases and submit samples of flu patients to the DPH Laboratory for testing. In addition, the department has asked physicians to be vigilant and watch for swine flu in their patients. Schools and child care providers have also been provided guidance and recommendations on how to advise staff, parents and children to stay home when they are sick and when children should be sent home.

DPH has also asked the public to do its part to protect themselves from and prevent the spread of the flu. Connecticut residents are being asked to stay home from work or school if they are sick, avoid others if they are ill, wash their hands often, and cough or sneeze into their upper sleeve or tissue.
